

No internet connection when connecting the network cable to the telecom server

Preview

This problem usually comes down to one of five things: a bad local network setting, a router or modem issue, DNS failure, an IP address conflict, or a wider ISP outage. The good news is that Ethernet "connected but no internet" is usually fixable without replacing hardware. The key components of an Ethernet connection include: Network Interface Card (NIC): This is a component within. When Windows shows "Unidentified network" on Ethernet, it usually means your PC connected to something electrically (link is up), but Windows couldn't get a valid IP configuration or identify the gateway/DNS needed to reach the internet. 2 Make sure your cable is plugged in correctly. 3 Try a different Ethernet port. 8 Check your internet. However, network issues such as no connection, random disconnections, or slow speed can disrupt network connectivity. Before we begin troubleshooting, here are.

Ethernet connections are generally considered to be more reliable and faster than Wi-Fi, but even wired connections
