

Price of a 630kW distribution box

Article Overview

The price of a 630 kW (or 630A) distribution box typically ranges from \$5,000 to \$25,000 or more, depending on type, materials, and features.

Pricing Overview

The cost of a 630 kW distribution box varies widely based on its design, capacity, and application. Portable solid rubber distribution boxes designed for construction sites with high safety and flexibility standards can cost several thousand dollars, often in the range of \$5,000-\$10,000 for units with multiple circuit breakers, earth leakage protection, and high-quality components from brands like Siemens or Bremas (Bos Elektro Hilversum) . Prefabricated box-type substations for industrial or residential use, which integrate high-voltage switchgear, transformers, and low-voltage distribution equipment, are more expensive due to their compact, intelligent, and fully enclosed design. These units can cost \$15,000-\$25,000 or higher, depending on customization, installation requirements, and compliance with European or international standards .

Factors Affecting Cost

- o Material and Construction: Steel, aluminum, or composite enclosures with corrosion resistance and fire retardation increase the price .
- o Capacity and Features: Higher amperage, multiple circuits, smart monitoring, and reactive power compensation add to the cost .
- o Installation and Commissioning: Prefabricated units may include on-site installation, which can significantly affect the total investment .
- o Customization: Color, exterior design, and specific mounting or labeling requirements can further increase the price .

Summary

For a 630 kW distribution box, expect a base price of around \$5,000 for portable units and up to \$25,000 or more for fully integrated prefabricated substations. Additional costs for installation, maintenance, and optional features should also be considered to determine the total project budget .
